A Classical Portfolio Optimization

i Time Series Plot

Figure 1

ii Rates of return

Using the equation 1 below, the daily rates of return were calculated and converted into a geometric daily rate of return with equation 2, which can be seen in table 1 on the following page.

$$r_{it} = \frac{I_{i,t} - I_{i,t-1}}{I_{i,t-1}} \quad (1)$$

$$\mu_i = \left(\prod_{t=1}^T (1 + r_{it}) \right)^{\frac{1}{T}} - 1 \quad (2)$$

Table 1: Arithmetic and Geometric Daily Returns

| Stocks | Arithmetic | Geometric |
|---------------|-------------------|------------------|
| AGL.JO | 0.001930 | 0.001562 |
| BHP.JO | 0.000957 | 0.000739 |
| BTI.JO | -0.000068 | -0.000210 |
| CFR.JO | 0.000559 | 0.000418 |
| CPI.JO | 0.001134 | 0.000841 |
| KIO.JO | 0.002674 | 0.002074 |
| MTN.JO | 0.000637 | 0.000238 |
| NPN.JO | 0.000719 | 0.000483 |
| SBK.JO | 0.000574 | 0.000337 |
| SOL.JO | 0.000576 | -0.000242 |

The volatility, covariance matrix, and correlation matrix were subsequently calculated as follows:

Table 2: Stock Volatility

| Stocks | Volatility |
|---------------|-------------------|
| AGL.JO | 0.027235 |
| BHP.JO | 0.020870 |
| BTI.JO | 0.016856 |
| CFR.JO | 0.016822 |
| CPI.JO | 0.024427 |
| KIO.JO | 0.034924 |
| MTN.JO | 0.028128 |
| NPN.JO | 0.021709 |
| SBK.JO | 0.021814 |
| SOL.JO | 0.040294 |

Table 3: Covariance Matrix

| Stocks | AGL.JO | BHP.JO | BTI.JO | CFR.JO | CPI.JO | KIO.JO | MTN.JO | NPN.JO | SBK.JO | SOL.JO |
|--------|----------|----------|-----------|----------|----------|----------|----------|----------|-----------|----------|

iii Setting up the Portfolio Optimisation Problem

To generate the optimal portfolio for an expected return R , the following formula was used, where:

- \mathbf{x} represents the proportion of starting capital to be allocated to each stock
- Σ represents the covariance matrix of the stock selection
- A and b ensure that the allocation does not exceed 100%
- C and d ensure that no stock receives a negative allocation.

$$\begin{aligned} & \underset{x}{\text{minimize}} && \frac{1}{2} \mathbf{x}^T \Sigma \mathbf{x} \\ & \text{subject to} && \mu^T \mathbf{x} \geq R, \\ & && A \mathbf{x} = b, \\ & && C \mathbf{x} \geq d \end{aligned} \tag{3}$$

This quadratic program was then used iteratively to generate the efficient frontier and composition of efficient portfolios plot seen in figures [2](#) and [3](#) on the following page.

iv Efficient Frontier and the Composition of Efficient Portfolios

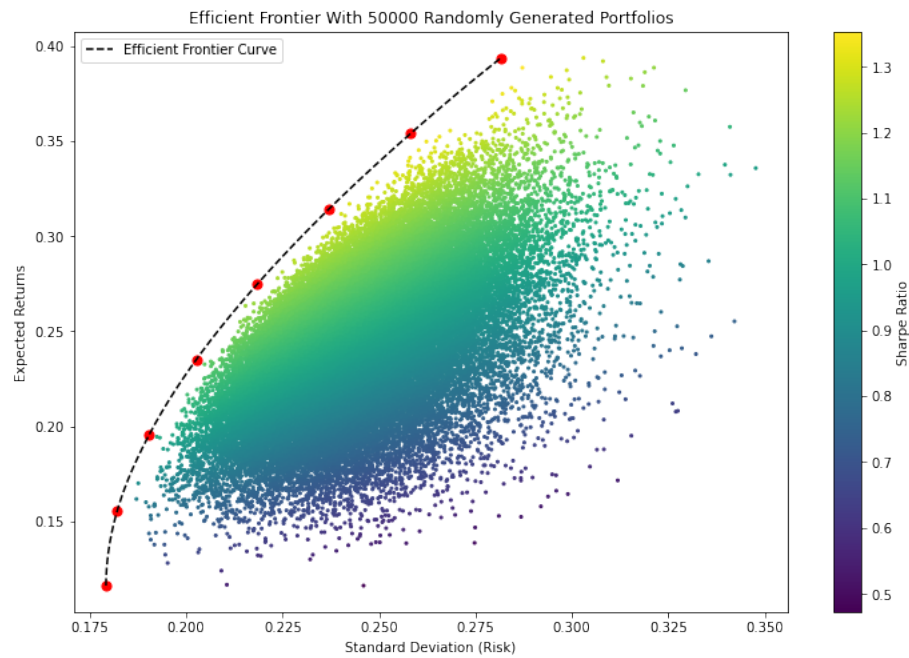

Figure 2

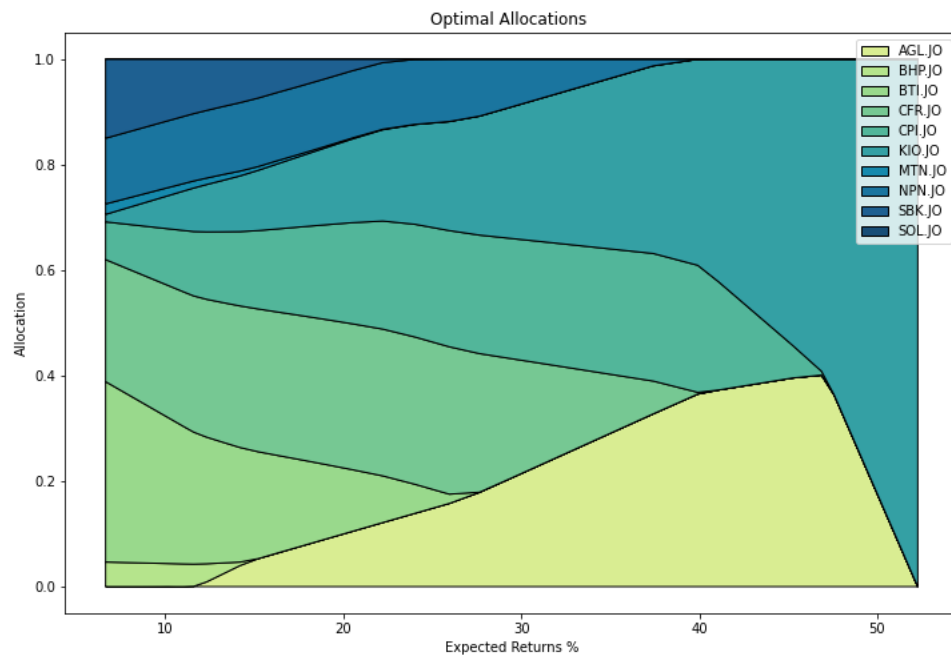

Figure 3

B Large-Scale Portfolio Optimization

i

Optimal portfolios can be significantly different if initial parameters are changed. Markowitz recommends using β_i , which is estimated through linear regression to determine u_i and σ_{ij} of a stock. The sum of β_i produces the β of the portfolio. An example of linear constraints restricting β between 0.9 and 1.1 is shown below.

$$\sum_{i=1}^n x_i \beta_i > 0.9 \quad (4)$$

$$\sum_{i=1}^n x_i \beta_i < 1.1 \quad (5)$$

Where:

- n represents the total maximum number of stocks allowed in the portfolio
- x_i represents the proportion of capital allocated to $stock_i$
- β_i represents the β of $stock_i$

ii

If we want to evenly partition stocks by capitalization: large, medium and small, we can add the following constraints:

$$\sum_{i \in k} x_i \leq m_k \quad (6)$$

$$m_l = m_m = m_s \quad (7)$$

Where:

- k represents the level of capitalisation, large, medium, small
- m represents the maximum size of each x_i

iii

This question uses the quadratic program shown in (8) to determine the optimal portfolio that satisfies the median return R . The average daily returns of each stock are shown below:

Table 5: Daily Returns

| Stocks | Daily Return |
|---------------|---------------------|
| AGL.JO | 0.001930 |
| BHP.JO | 0.000957 |
| BTI.JO | -0.000068 |
| CFR.JO | 0.000559 |
| CPI.JO | 0.001134 |
| KIO.JO | 0.002674 |
| MTN.JO | 0.000637 |
| NPN.JO | 0.000719 |
| SBK.JO | 0.000574 |
| SOL.JO | 0.000576 |

The median of the daily returns column in table 5 is calculated as 0.0006778, this number is used to represent R in the quadratic program shown below, which suggests the allocation shown in table 6:

$$\begin{aligned}
 & \underset{\mathbf{x}}{\text{minimize}} && \frac{1}{2} \mathbf{x}^T \Sigma \mathbf{x} \\
 & \text{subject to} && \mu^T \mathbf{x} \geq R, \\
 & && A \mathbf{x} = b, \\
 & && C \mathbf{x} \geq d
 \end{aligned} \tag{8}$$

Table 6: Median Portfolio

| Stocks | Allocation |
|---------------|-------------------|
| AGL.JO | 0.04979 |
| BHP.JO | 0.10062 |
| BTI.JO | 0.15430 |
| CFR.JO | 0.12157 |
| CPI.JO | 0.09148 |
| KIO.JO | 0.01108 |
| MTN.JO | 0.11726 |
| NPN.JO | 0.11319 |
| SBK.JO | 0.12061 |
| SOL.JO | 0.12009 |

iv

Since the median portfolio is based off of historical data, it may not be robust to market fluctuations, to test this we will multiply each of our daily returns by a random number in the range of $[0.95, 1.05]$, this will show what could have happened if the stocks had performed either 5% better or 5% worse.

Table 7: Median Portfolio with fluctuations

| Stocks | Median | Fluctuation #1 |
|--------|---------|----------------|
| AGL.JO | 0.04979 | 0.05003 |
| BHP.JO | 0.10062 | 0.10062 |
| BTI.JO | 0.15430 | 0.15404 |
| CFR.JO | 0.12157 | 0.12146 |
| CPI.JO | 0.09148 | 0.09152 |
| KIO.JO | 0.01108 | 0.01151 |
| MTN.JO | 0.11726 | 0.11718 |
| NPN.JO | 0.11319 | 0.11313 |
| SBK.JO | 0.12061 | 0.12051 |
| SOL.JO | 0.12009 | 0.11999 |

This yielded the results shown in table 8, it was observed that the fluctuated portfolio achieved slightly higher return but also slightly higher risk.

Table 8: Portfolio Results

| Portfolio | Annualised Risk | Annualised Return |
|----------------|-----------------|-------------------|
| Median | 12.488137 | 17.08179 |
| Fluctuation #1 | 12.492148 | 17.116919 |

Three more fluctuations were made and subsequently averaged to generate a more robust portfolio that can handle market fluctuations. This can be seen in table 9, and the performance of each portfolio can be seen in table 10.

By comparing the mean portfolio to the median portfolio we see that the mean portfolio is less risky, but also less profitable with a lower return. The weightings only change slightly across all fluctuations.

Table 9: Fluctuations

| Stocks | Median | F #1 | F #2 | F #3 | F #4 | Mean |
|---------------|---------------|-------------|-------------|-------------|-------------|-------------|
| AGL.JO | 0.04979 | 0.05003 | 0.04969 | 0.05075 | 0.05214 | 0.050480 |
| BHP.JO | 0.10062 | 0.10062 | 0.10063 | 0.10061 | 0.10059 | 0.100614 |
| BTI.JO | 0.15430 | 0.15404 | 0.15441 | 0.15327 | 0.15177 | 0.153558 |
| CFR.JO | 0.12157 | 0.12146 | 0.12161 | 0.12116 | 0.12056 | 0.121272 |
| CPL.JO | 0.09148 | 0.09152 | 0.09146 | 0.09165 | 0.09188 | 0.091598 |
